## Data security certification

Data centre specialist MDS Technologies has achieved ISO 27001 certification for its state-of-the-art facilities, guaranteeing data security to the highest possible benchmark.

The company operates data centres across the South of England, helping companies to streamline their IT function by offering high availability, co-location services.

International standard ISO 27001 is the globally recognised information security management system (ISMS) that demonstrates compliance to a wide range of security controls. It also establishes a framework for information security that conforms to best practice.

'This accreditation reflects our commitment to providing the highest standards of operational excellence,' said Phil Dawson, MDS Technologies' Managing Director.

'It is independently validated following an extensive audit and ensures our customers can have peace of mind knowing their data is safe from potential security threats and vulnerabilities.'

MDS Technologies, which has already achieved ISO 9001 quality management certification, boasts such high profile clients as Vodafone, Navman Wireless, Guys & St Thomas Hospital Trust, and Tibboh.
